

Construct validity of d_c without human labels by us: a deterministic regex, the benchmark authors, and LLMs converge

a Three independent channels measure the same d_c

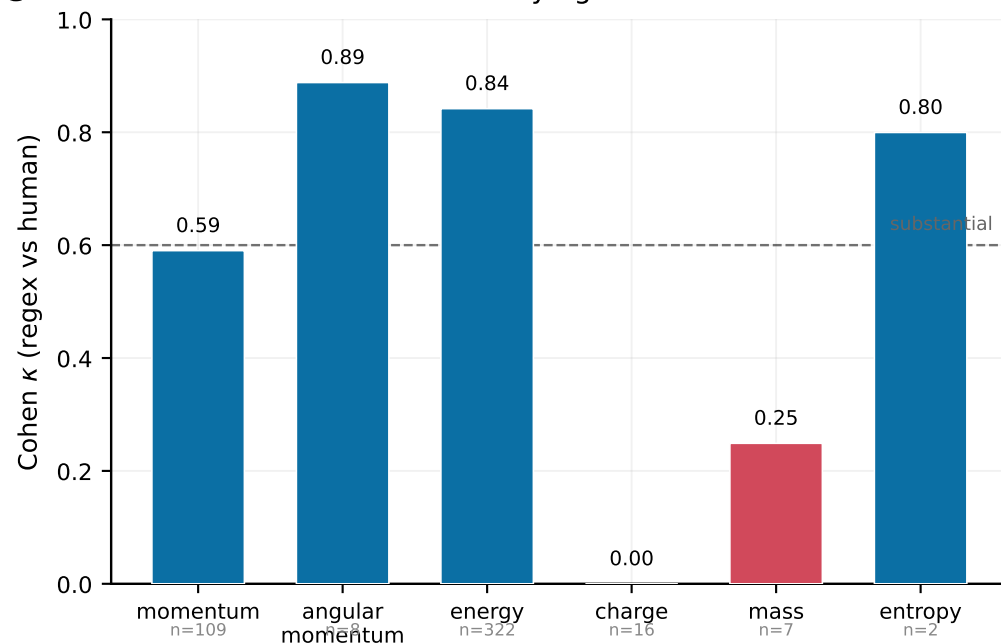

pairwise agreement of a rule system, human labels, and LLMs
 $\Rightarrow d_c$ is an objective item property, not an LLM artefact

b Swap in a zero-LLM d_c : the effect persists

c Per-family agreement

d Both channels track difficulty ($\sim 3\times$ rise)
